AMSER Rad Path Case of the Month

70 y/o F presents with acute worsening N/V, abd pain in setting of 8 months of bloating & early satiety

Emily Kuo, MS4, Drexel University College of Medicine
Dr. Matthew Hartman, MD, Radiology, Allegheny Health Network (AHN)
Dr. John Nakayama, MD, Gynecologic Oncology, AHN
Dr. Madeline Riley, DO, Pathology, AHN
Dr. Angela Sanguino Ramierz, MD, Pathology, AHN

AMSER

Patient Presentation

- HPI: Pt presents to outside hospital with 24 hours of acute N/V and abd pain, in setting of early satiety & bloating x8 months. Found to have new pelvic mass on CT A/P w/o contrast and transferred to AHN for Gyn Onc consult.
- PSH: TAH + RSO w/ bowel resection, LSO for Ectopic, Lap cholecystectomy, appendectomy
- PMH: HTN, Hypothyroidism, Depression, GERD
- Meds: HCTZ-valsartan, amlodipine, levothyroxine, sertraline, trazodone, omeprazole
- Allergies: NKDA

Patient Presentation

- ObHx: G1P0
- GynHx: Menopause at 39 s/p TAH, RSO; HPV (+) prior to TAH; Denies hx of STI

Patient Presentation

- Physical Exam: VSS; Abd soft, non-tender to palpation, mildly distended w/ palpable mass in lower abd. Normoactive bowel sounds. Pelvic exam declined.
- Labs:
  - **CA 125**: 10
  - **CEA**: <1.8
  - **CA 19-9**: 15

What Imaging Should We Order?

Applicable ACR Appropriateness Criteria

Postmenopausal Subacute or Chronic Pelvic Pain

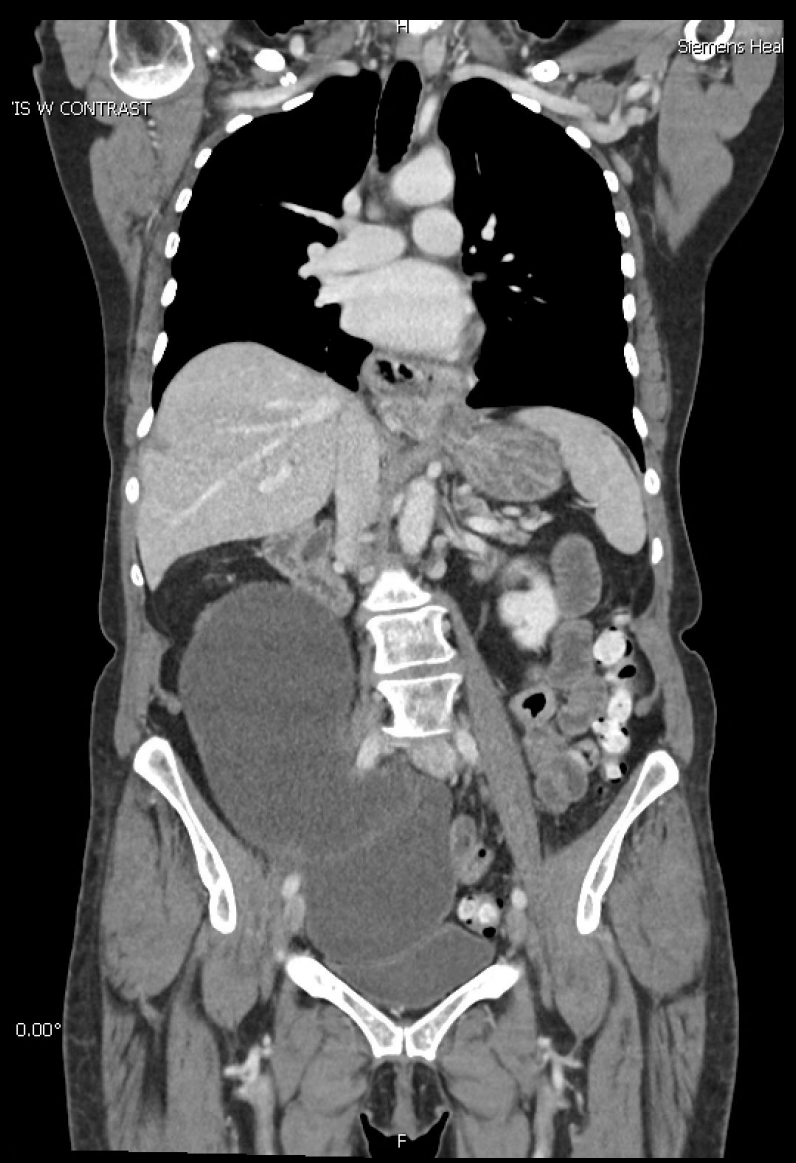
Variant 1: **Postmenopausal subacute or chronic pelvic pain, localized to the deep pelvis. Initial imaging.**

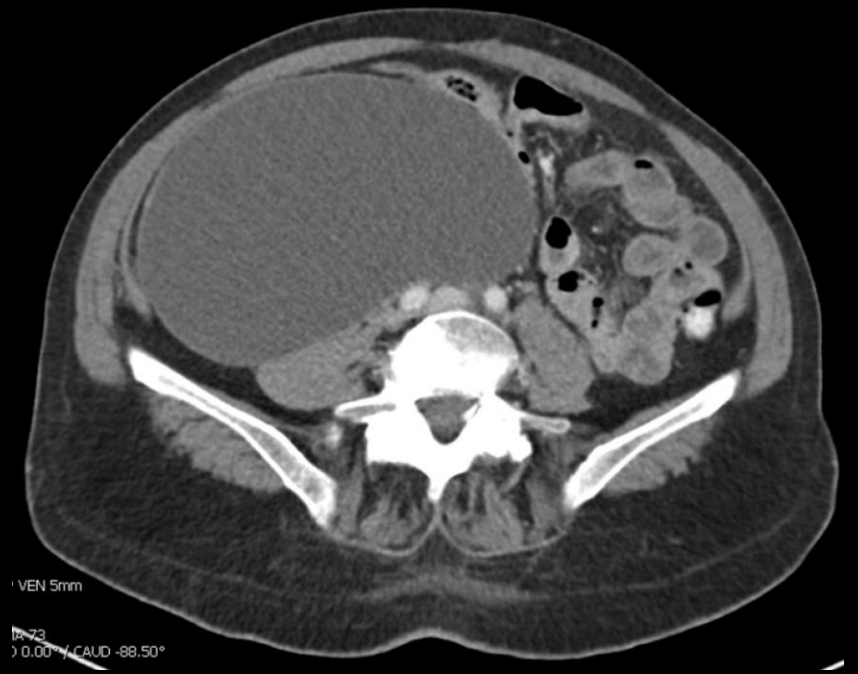
Procedure	Appropriateness Category	Relative Radiation Level
US pelvis transvaginal	Usually Appropriate	O
US duplex Doppler pelvis	Usually Appropriate	O
US pelvis transabdominal	Usually Appropriate	O
MRI pelvis without and with IV contrast	May Be Appropriate	O
CT abdomen and pelvis with IV contrast	May Be Appropriate	☢☢☢
CT pelvis with IV contrast	May Be Appropriate	☢☢☢
MRI pelvis without IV contrast	May Be Appropriate (Disagreement)	O
CT abdomen and pelvis without and with IV contrast	Usually Not Appropriate	☢☢☢☢
CT abdomen and pelvis without IV contrast	Usually Not Appropriate	☢☢☢
CT pelvis without and with IV contrast	Usually Not Appropriate	☢☢☢☢
CT pelvis without IV contrast	Usually Not Appropriate	☢☢☢
Radiography abdomen and pelvis	Usually Not Appropriate	☢☢☢

This imaging modality was ordered by admitting medicine service

AMSER

Radiology Findings (unlabeled)

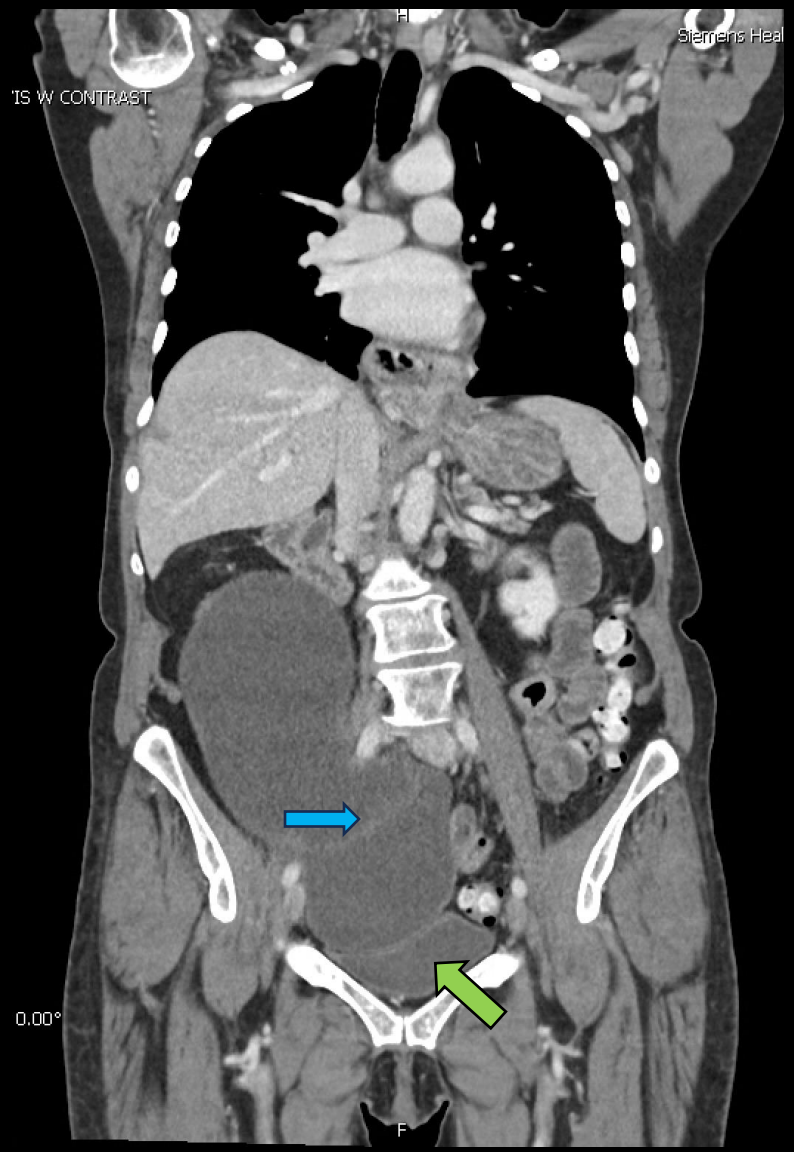




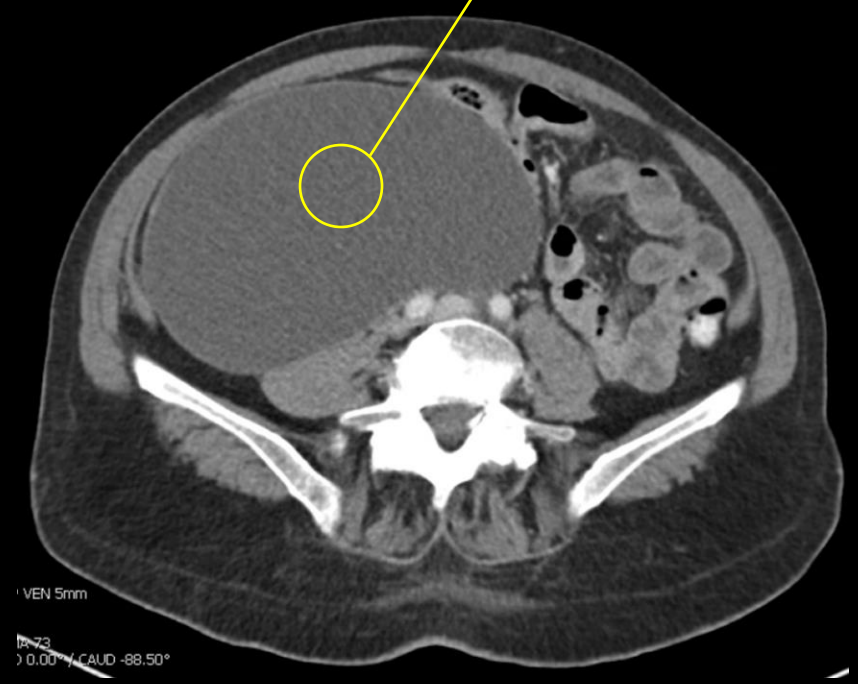
AMSER

Radiology Findings (labeled)

Multiloculated Cystic Lesion measuring 21.6 x 9.2 x 16.2 cm



Mean Hounsfield Units: +11.42, Consistent w/ Water



Blue Arrows indicating Septations

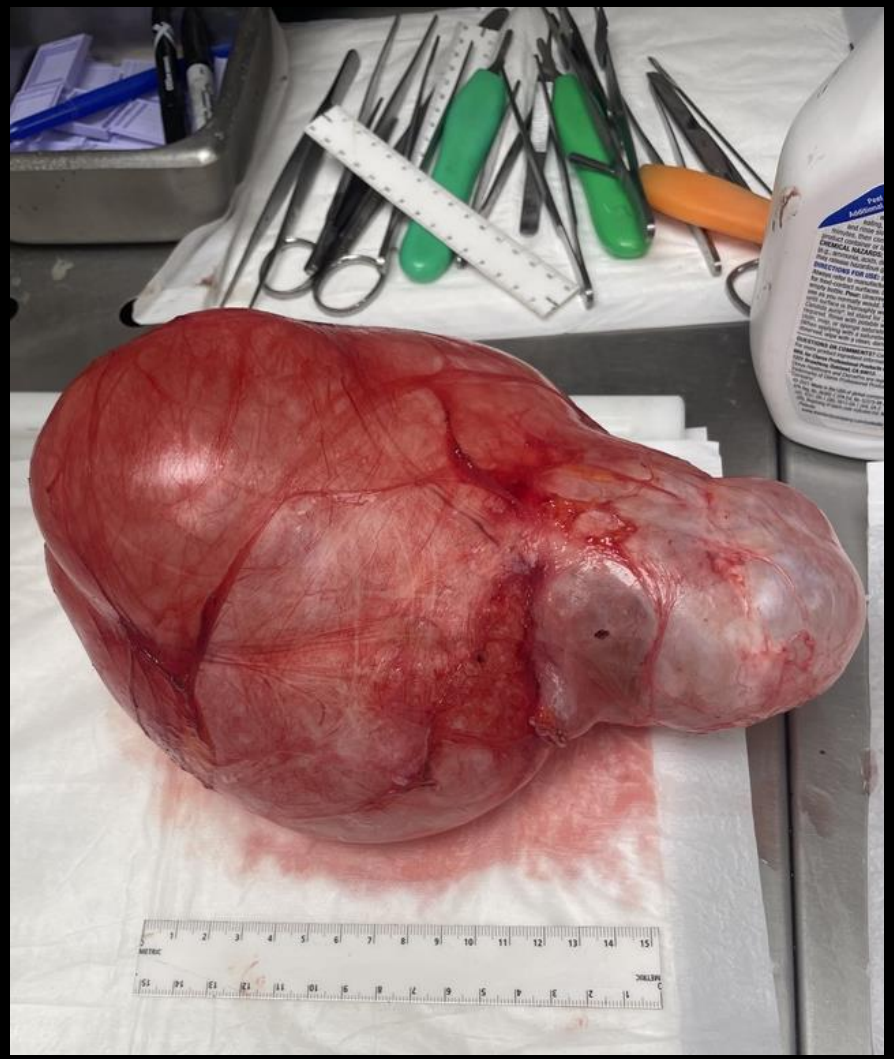
Green Arrows indicating Bladder

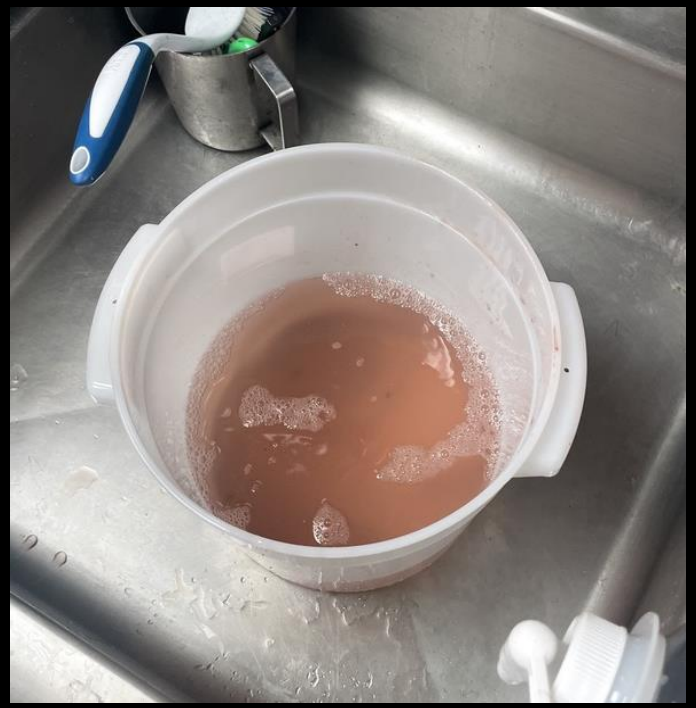
AMSER

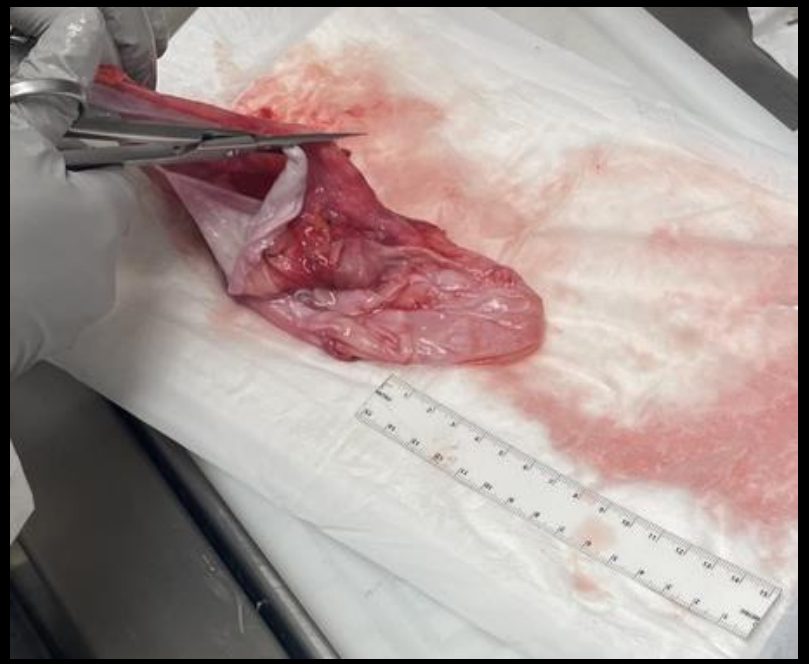
DDX Based on Imaging

- DDX:
  - Cystadenoma vs. GI Duplication Cyst vs. Peritoneal Cyst
  - Less likely Borderline or Malignant mass from ovarian remnant, given normal tumor markers & cystic appearance

Gross Findings



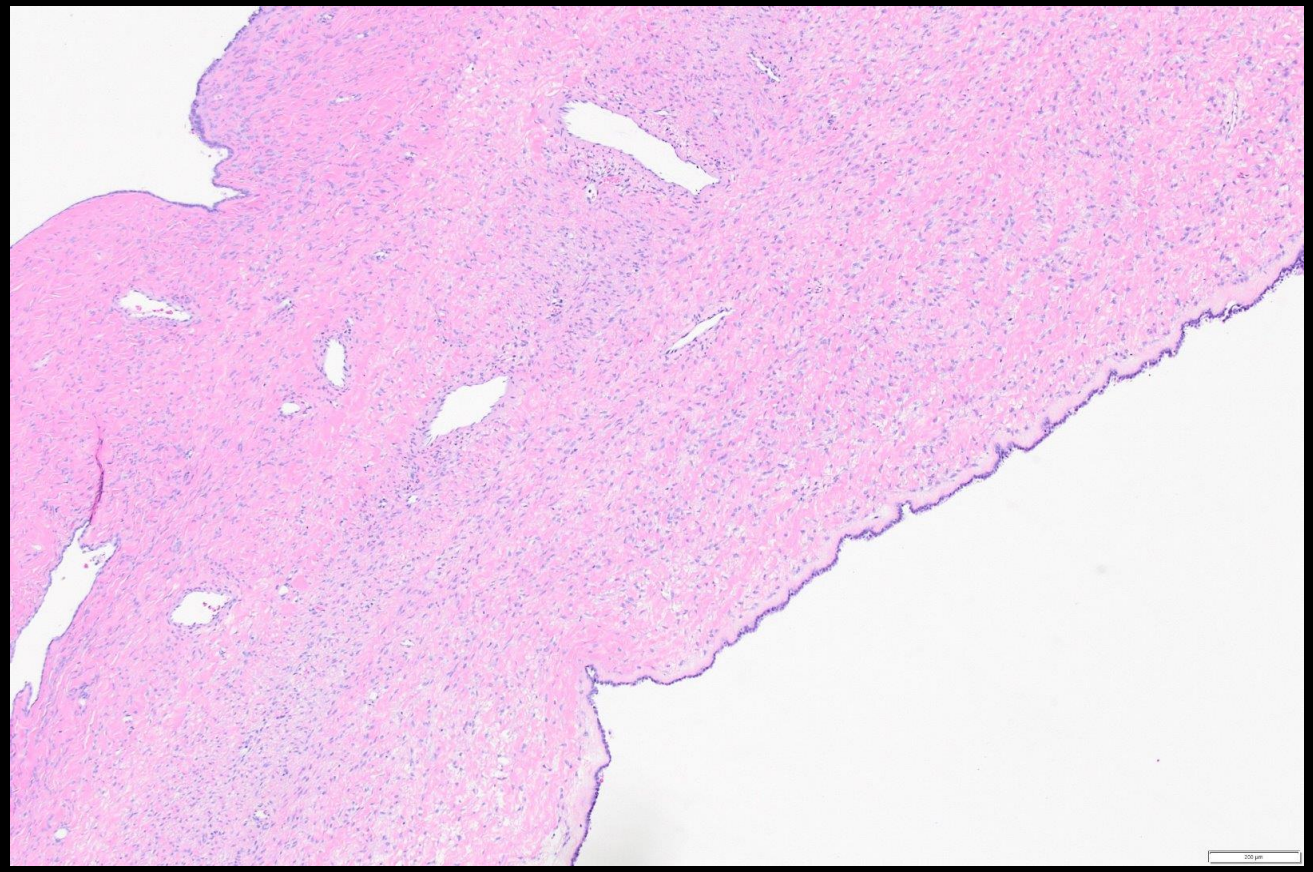


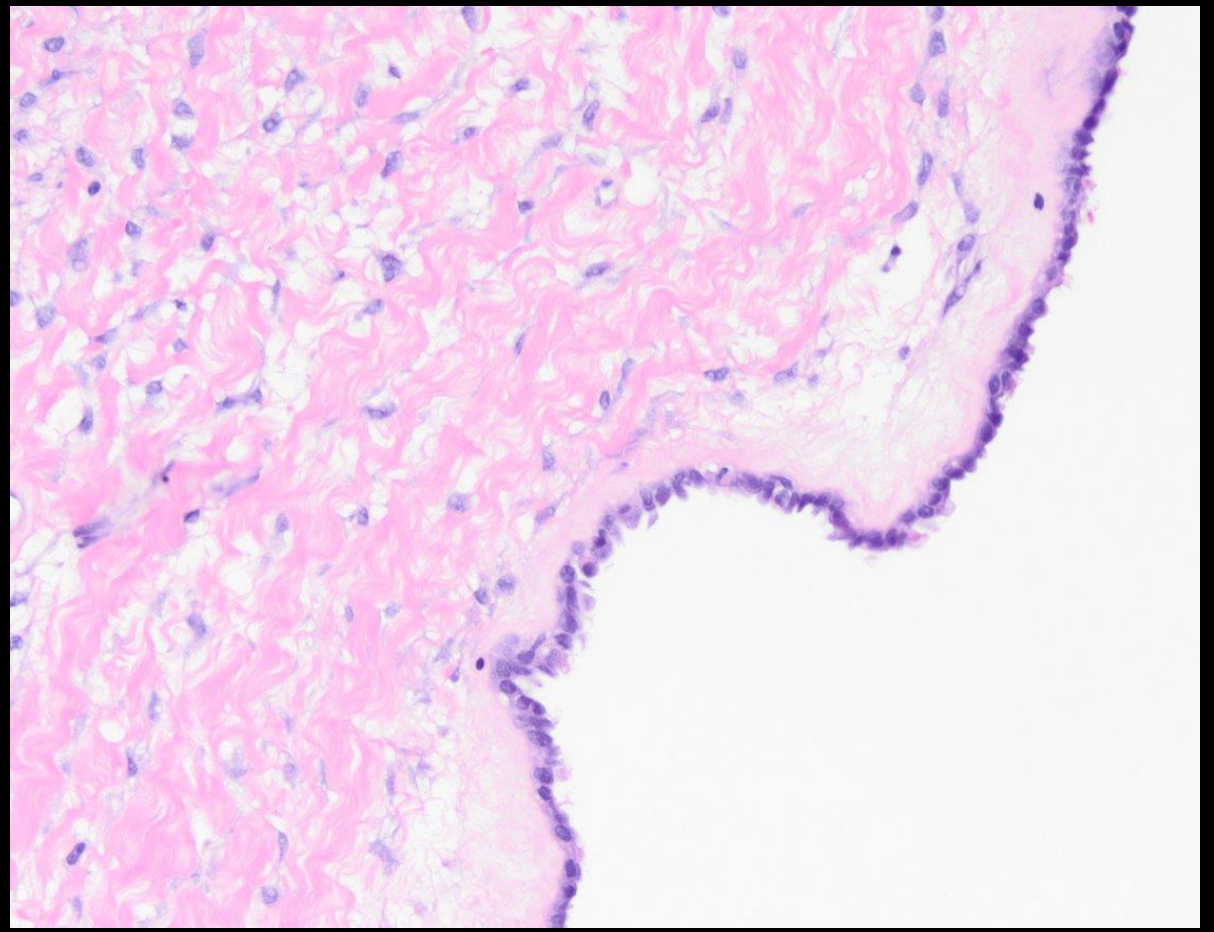


Final Dx:

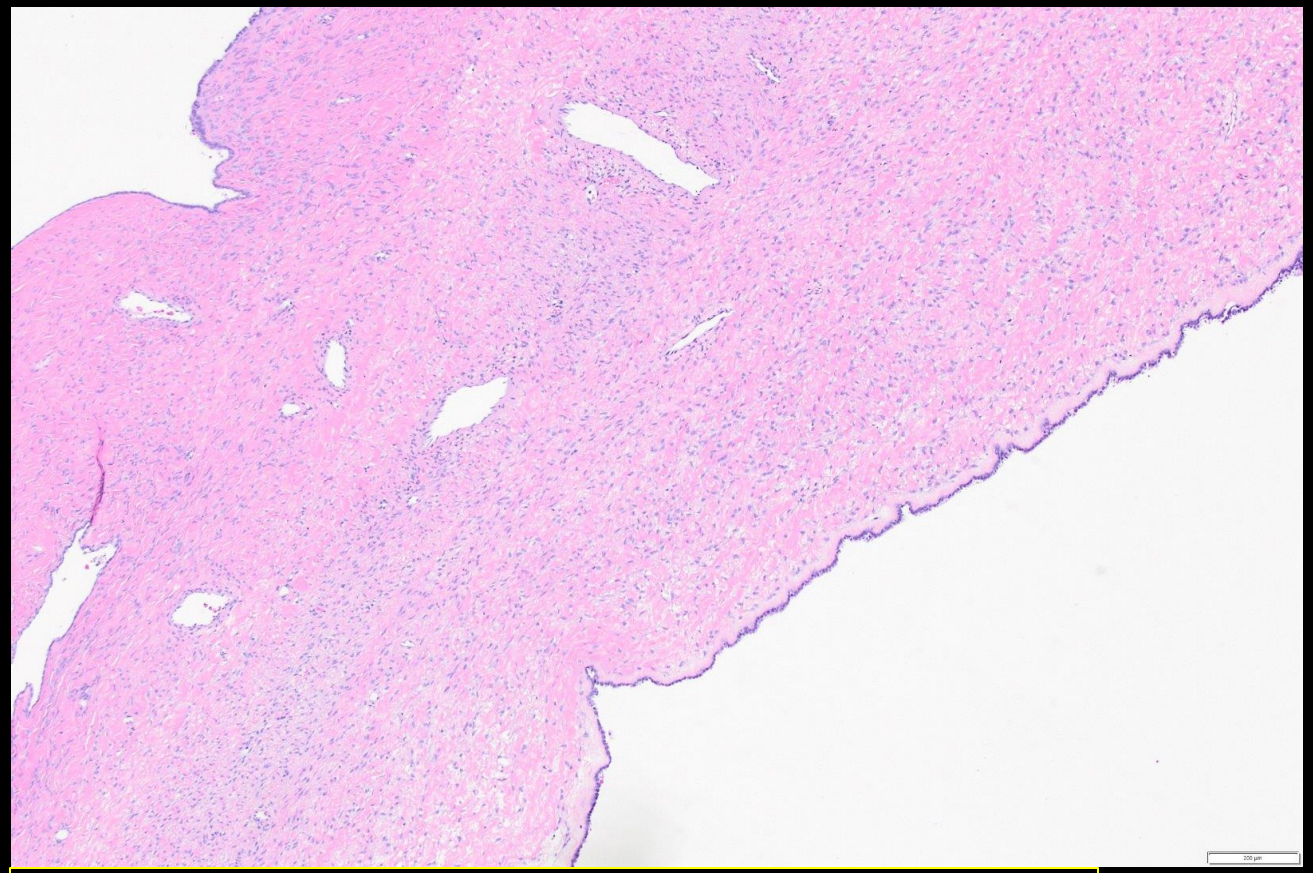
Benign Mucinous Cystadenoma

Pathology Findings (unlabeled)

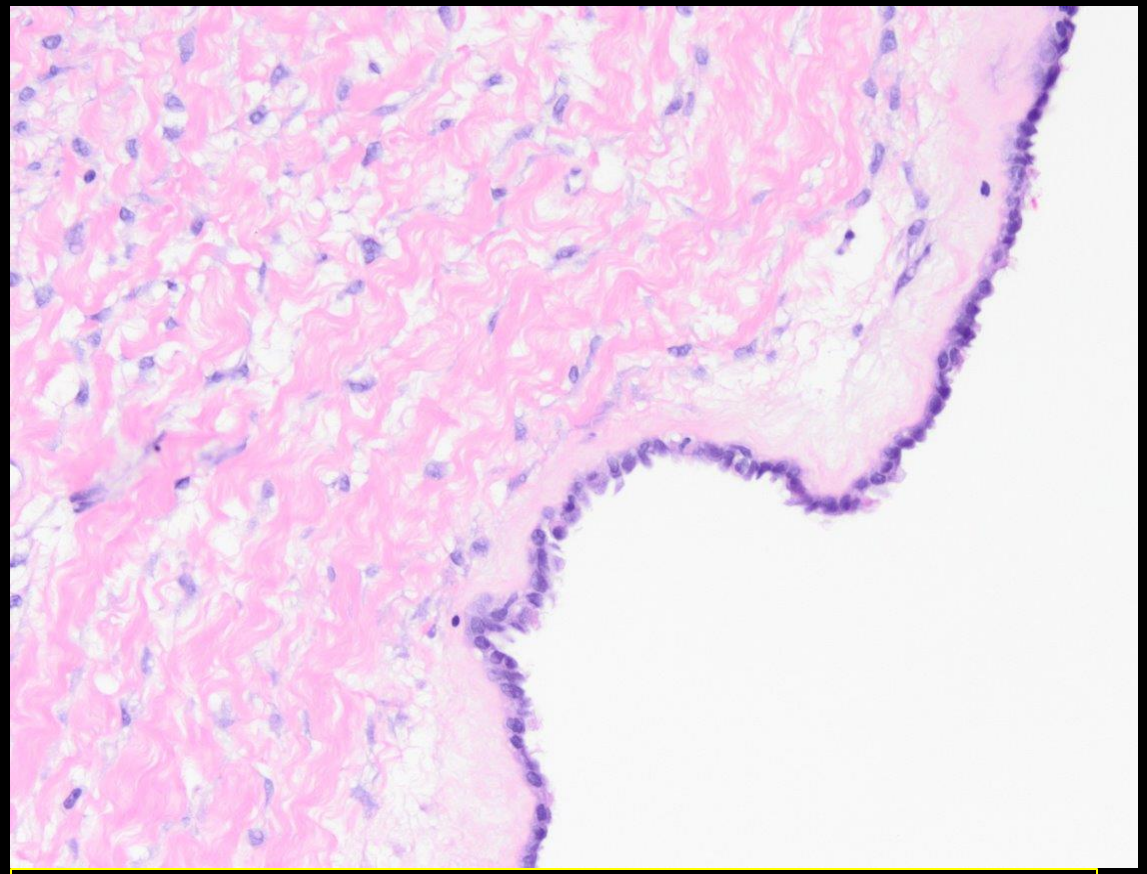




Pathology Findings (labeled)



Benign mucinous cyst at 4x: Dense fibrous tissue lined by a single layer of flat cells with no cytologic atypia



Benign mucinous cyst at 20x: Simple cuboidal cell lining without cytologic atypia

Case Discussion: Adnexal Mass

- Definition: Mass on an appendage of the Uterus
  - Can be on Ovary, Fallopian Tube, or Uterine Ligaments
- Will have a Wide Differential
- Important to determine Benign vs. Malignant probability
- Important Things to Consider:
  - Ovarian vs. Extra-Ovarian
  - Solid vs. Cystic
  - Pre vs. Post-menopausal

Case Discussion: Adnexal Mass

- Presentation:
  - Often Asymptomatic
  - May have Pelvic Pain, Palpable Mass, Acute Abdomen (w/ rupture)
- Imaging:
  - First Line: **Transvaginal US**
  - CT, MRI, PET are NOT recommended for initial evaluation
  - CT or MRI may be used to further define mass

DDX for Adnexal Mass

- Benign Gyn
  - Functional Cyst
  - Endometrioma
  - Tubo-ovarian Abscess
  - Ectopic Pregnancy
  - Mature Teratoma
  - Cystadenoma
  - Paratubal Cyst
  - Leiomyoma
- Malignant Gyn
  - Ovarian CA:
    - Epithelial
    - Germ Cell
    - Stromal
  - Metastatic CA
- Non-Gyn
  - GI/ Urologic process
    - Abscess
    - Diverticulum
    - Primary/ Metastatic CA

Case Discussion:

- Main Complications of Adnexal Mass:
  - Ovarian Torsion
  - Rupture/ Peritonitis
  - Malignant Transformation

Case Discussion:

- Reminder: Very important to determine Benign vs. Malignant probability of an Adnexal Mass
- Findings concerning for malignancy:
  1. >10 cm
  2. Papillary/Solid components
  3. Irregular shape
  4. High Blood Flow on Color Doppler US
  5. Ascites
  6. Elevated CA-125
